
WORK IN PROGRESS

OVERVIEW

For eons, the **Ancient Ones** have lain dormant, leaving humankind to carry on its existence in blissful ignorance. But the Ancient Ones have begun to stir in their slumber, and doom now comes to Arkham.

In Arkham Horror: Remastered, 1–8 players take on the roles of investigators seeking to prevent the cataclysmic awakening of an Ancient One. The rising eldritch influence causes tears in reality, opening **gates** to **Other Worlds** and allowing unspeakable abominations to cross into Arkham.

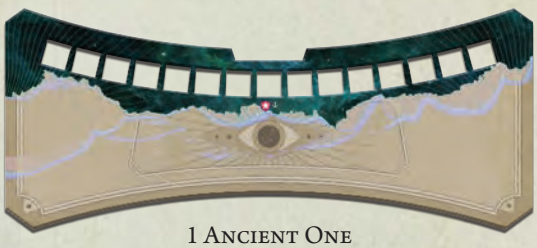
To save their world, investigators must close all such gates into the city, or permanently seal enough gates to prevent the Ancient One's arrival on Earth. Should they fail to do so, they will engage in one **final battle** against the arisen Ancient One, with the fate of humanity hanging in the balance.

1 Game Board

16 Investigator Sheets

8 Investigator Dashboards

8 Ancient One Sheets



1 Ancient One Dashboard

COMPONENT LIST

67 Mythos Cards

63 Arkham Location Cards

49 Other World Cards

4 Player Count Cards

8 Reference Cards

44 Common Item Cards

39 Unique Item Cards

40 Spell Cards

20 Skill Cards

11 Ally Cards

8 Blessed/Cursed Cards

8 Retainer Cards

8 STL Membership Cards

8 Bank Loan Cards

3 Deputy Role Cards

3 Magical Effect Cards

1 Lead Investigator Token

16 Investigator Stands

48 Clue Tokens

24 Elder Sign Tokens/ Counters

6 Activity Tokens

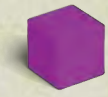
6 Closed Tokens

3 Explored Tokens

1 Terror Token

56 Money Tokens

1 Doom Cube



1 Hit Tracker Cube

1 Turn Tracker Cube

1 Player Count Cube

5 Dice

16 Gate Tokens

60 Monster Tokens

1 Monster Bag

16 Maximum Cubes

24 Attribute Cubes

8 Stamina Cubes

8 Sanity Cubes

SETUP

To set up the game, resolve the following steps:

1. Set Up Game Board

Place the game board in the center of the play area. Place the terror token on the "0" space of the terror track.

Terror Token

2. Place Starting Clues

Place 1 clue on each unstable location; unstable locations are indicated by a red diamond.

Unstable Location Clue Token

3. Create General Supplies

Create general supplies out of the game's tokens and dice and place them near the game board.

4. Create Card Decks

Gather each type of card and place them in decks near the game board.

5. Create Monster Supply

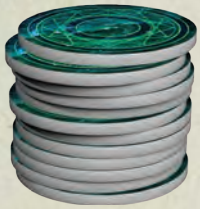
Gather all of the monster tokens and separate out all of the **Mask** monsters. Place the rest of the monster tokens into a bowl, bag, or cup to create the monster supply.

Monster Tokens

Monster Bag

Mask Monster Tokens

6. Create Gate Stack



Shuffle the gate tokens facedown to create the gate stack.

7. Determine Ancient One

Randomly select an Ancient One sheet and place it next to the game board. Alterrnatively, players may agree to choose which Ancient One they are going to fight. It is recommended that new players play against Azathoth for their first game.

8. Set up Ancient One Dashboard

Slide the Ancient One sheet into the Ancient One dashboard with the gameplay side of the Ancient One faceup; this is the side that has the abilities on the righthand side of the sheet. Place the green doom cube on the "0" notch of the doom track. Resolve any Ancient One-specific setup instructions. Set the turn tracker, hit tracker, and player count cubes aside; these are used during the final battle.

Setup

Doom Cube

9. Determine Lead Investigator

Choose one player to take the lead investigator token. Players can select the lead investigator randomly, or select the player that has the most experience playing the game.

Lead Investigator Token

10. Determine Investigators

The lead investigator deals each player a random investigator sheet. Alternatively, players may agree to choose which investigator they are going to play.

WORK IN PROGRESS

11. Gain Fixed Possessions

Each player gains the possessions listed under the "Fixed Possessions" header on the back of their investigator sheet, searching the relevant decks for specific cards. Then, shuffle all decks that contain randomized cards.

12. Gain Random Possessions

Each player draws cards from the decks indicated under the "Random Possessions" header on the back of their investigator sheet and gains them; if an investigator has an ability that can be used during setup, they can use it here.

13. Place Investigators

Each player finds the investigator stand that matches their investigator and places it on the game board location listed under the "Home" header on the back of their investigator sheet.

Investigator Sheet Back

14. Set Up Investigator Dashboards

Each player slides their investigator sheet into their investigator dashboard. They place their sanity and stamina cubes into the starting notches of the sanity and stamina track, respectively. These notches are also indicated by a diamond shape in their background. Place the black maximum sanity and maximum stamina cubes one notch above the sanity and stamina cubes. If an investigator begins the game with a card that increases their maximum sanity or stamina, make additional adjustments the initial setup.

Each player determines their starting attributes by placing one attribute cube into a notch of their choice in each of the three attribute columns. Each cube determines the value of the attribute to its left and its right, with higher numbers indicating a greater number of dice rolled—and thus a greater chance of success—and lower numbers indicated a lesser number of dice rolled.

15. Resolve Starting Mythos Card

The lead investigator draws the top card of the mythos deck and resolves it as detailed in the "Phase IV: Mythos" section on page 21; if the drawn Mythos card has the *Rumor* trait or there is not a gate pictured in its upper-left corner, discard it and draw again.

Mythos Card

16. Begin The Game

The players are now ready to begin the game.

WORK IN PROGRESS

WINNING THE GAME

The central goal of Arkham Horror is to win the game by defeating the Ancient One. This can be done in one of three different ways, as follows; don't worry if you don't understand them now, just keep these in mind as you read the rules.

Close All Gates

If at any point, **both** of the following conditions are met, the investigators immediately win the game.

- All gates on the game board are closed.
- The investigators have a number of unspent gate trophies equal to or greater than the number of investigators.

Gate Token

Because a variety of game effects can spawn gates , and because gates typically require multiple turns to close, this can be a difficult method of winning the game early on. However, it becomes easier to achieve as more elder sign tokens are placed on the board. Elder sign tokens prevent gates from spawning in their spaces, which makes life easier for everyone.

Seal Six Gates

If at any point there are six elder sign tokens on the board, the investigators immediately win the game. An elder sign token is placed when an investigator closes a gate and then, optionally, spends clues to seal it.

Elder Sign Tokens

Win the Final Battle

If none of the previous conditions are met, and the Ancient One awakens, the last chance for the investigators to win the game is to emerge victorious from the final battle. More than likely, if the investigators are forced to face the Ancient One in battle, they will die.

WORK IN PROGRESS

THE ANCIENT ONE

The Ancient One is an agent of the Mythos, and the primary antagonist in a game of ***Arkham Horror***. It is a horrific creature that defies the logic of reality, slumbering in the earth until it can awaken and bring its full power to bear against humanity.

Persistent Effects

Even while the Ancient One stirs in its slumber, it has an effect on the game. The front of the Ancient One sheet contains all of the instructions needed to resolve the Ancient One's persistent effects.

Doom

As the game progresses, gates and other game effects will cause **DOOM** to advance. For each point that doom advances, move the doom cube one notch to the right. Doom serves as the game's timer, and the investigators have until the doom track is full to close or seal the requisite number of gates and win the game. If the doom cube advances to the final space of the doom track, *the Ancient One awakens*, and play proceeds to the final battle (see "The Final Battle" on page 29).

Open Gates

The Ancient One can also awaken if too many gates are open at once. Investigators must keep this in mind as they play the game and do their best to keep the number of open gates under control.

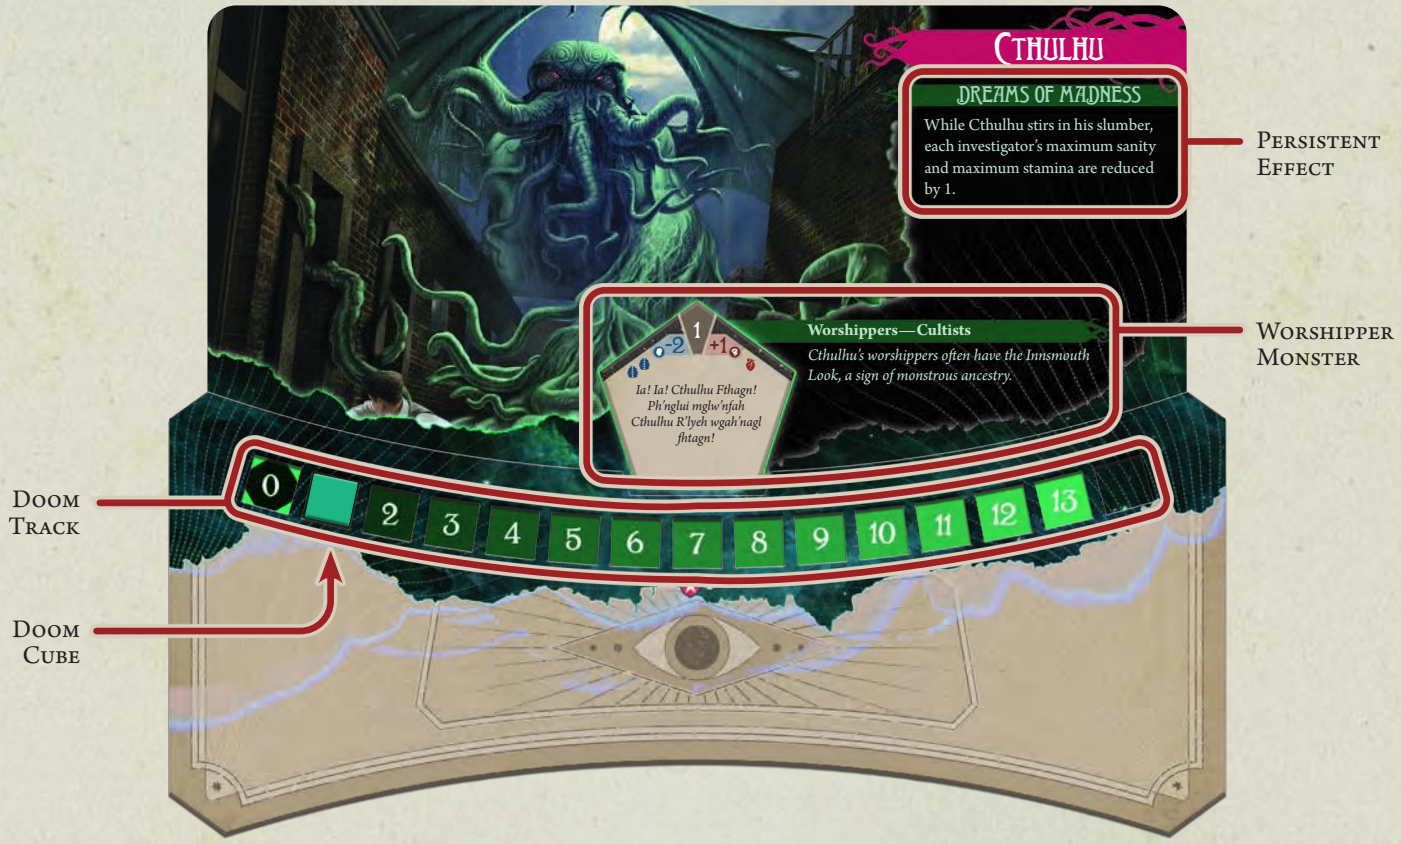
The Ancient One awakens, and play proceeds to the final battle (see "The Final Battle" on page 29) if the following open gate thresholds are met:

Investigators	*The Ancient One Awakens* at:
1–2	8 open gates
3–4	7 open gates
5–6	6 open gates
7–8	5 open gates

Worshipper Monsters

Each Ancient One has its own worshippers. Worshipper monsters gain special strength, often increasing the monster's toughness, combat damage, or other abilities.

An Ancient One's worshipper monsters are shown on its sheet. If a worshipper monster is drawn, use the printed token back on the Ancient One sheet when in combat with that monster instead of the token itself.



WORK IN PROGRESS

The following concepts are central to understanding the rules of the game.

Investigators

During setup, each player sets up an investigator in their play area. Each investigator is represented by a standee on the game board, a sheet that shows their abilities, and a dashboard that tracks their sanity, stamina, and attributes. From here on, and on all game components, players are referred to as investigators.

Lead Investigator

The investigator that took the lead investigator token during setup is the **LEAD INVESTIGATOR**. During each upkeep phase, a different player will become the lead investigator for that game round. The lead investigator has three main responsibilities.

Lead Investigator Token

1. Goes First in Player Order

The lead investigator token is first in **TURN ORDER**.

2 Resolves General Game Effects

General game effects that are not specific to an investigator are resolved by the lead investigator.

3. Breaks Ties

When a game effect specifies a target and there is a tie (for example "the investigator that has the highest current stamina"), and the players as a group cannot agree, the lead investigator chooses. Likewise, when multiple general game effects are resolved in the same timing window, the lead investigaor chooses which order they are resolved in.

Turn Order

Turn order is the order in which investigators resolve game effects. When an effect is resolved in turn order, begin with the lead investigator and proceed clockwise. Most phases in a game round are resolved in turn order. Additionally, when resolving a global game effect (such as "Each investigator loses 1 stamina"), that effect is resolved in turn order.

Investigator Sheet and Dashboard

An investigator's sheet and dashboard detail their sanity, stamina, attributes, focus, and investigator abilities.

Sanity and Stamina

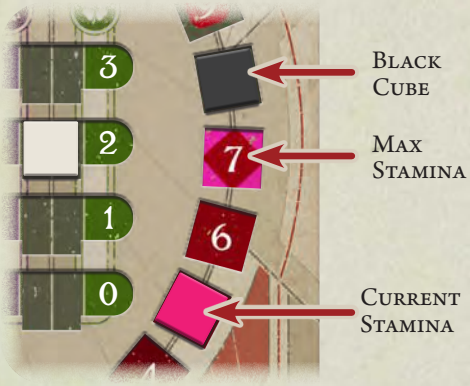
An investigators sanity and stamina are tracked by blue and red cubes, respectively, and their initial values are set during setup. When an investigator loses sanity or stamina, they move the respective cube down a number of notches equal to the amount lost.

When an investigator's sanity is reduced to 0, that investigator is driven **INSANE**. When an investigator's stamina is reduced to 0, that investigator is knocked **UNCONSCIOUS**. If an investigator's sanity and stamina are both reduced to 0 simultaneously, that investigator is **DEVOURED**.

When an investigator **RECOVERS** sanity or stamina, they move the respective cube up a number of notches equal to the amount recovered.

Maximum Sanity and Stamina

Investigators have a default maximum sanity and stamina. During setup, black cubes are placed to indicated the point at which the maximums would be surpassed. An investigator cannot recover sanity or stamina beyond their maximums.



A black cube on 8 stamina indicates that an investigator's maximum stamina is 7.

Certain game effects can increase or decrease an investigator's maximum values. Maximums can be increased by no more than 3 beyond an investigator's initial value. Investigators do not automatically recover sanity or stamina when their maximums are increased unless otherwise specified.

If an investigator's maximum sanity or stamina is lowered to a value below their current sanity or stamina, their current sanity or stamina is lowered to match that maximum. If an investigator's maximum stanity or stamina is reduced to 0, that investigator is *devoured*.

WORK IN PROGRESS

Attributes

An investigator's **ATTRIBUTES** each represent a different physical or mental characteristic, which determines how many dice are rolled when that characterstic is tested. Attribute cubes are are placed during setup and indicate the current values of each attribute pair.

Each attribute is tied to another attribute as follows:

- Speed and Sneak
- Fight and Will
- Lore and Luck

There is an inverse relationship between each pair of attributes. For example, the higher an investigator's speed, the lower their sneak will be.

Each investigator has a different ranges for their attributes. While the initial positions of the attribute cubes are decided during setup, an investigator can spend focus during the upkeep phase to adjust their attributes as the game progresses.

Many items, allies, and other cards can increase or decrease an investigator's attributes. Sometimes, these modifiers are constantly active. Other times, they are are only applied when specific conditions are met. These modifiers affect the value of an attribute but do not move the attribute cube.

Focus

An investigator's focus value represents their ability to fine-tune their attributes, as detailed in the "Focus Attributes" section on page 13. On rare occasions, focus can be spent on other game effects.

Investigator Abilities

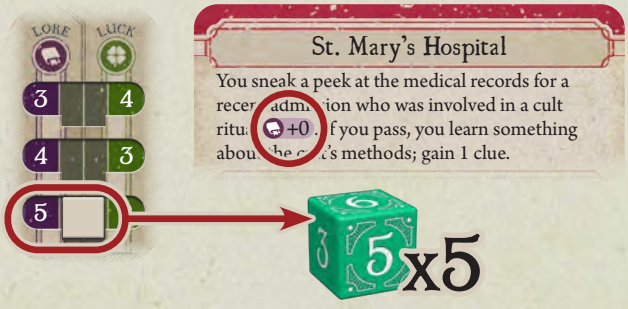
Each investigator has one or more abilities, as detailed on the right-hand side of their investigator sheet. These abilities are extremely varied and represent the core of what makes each investigator unique.

WORK IN PROGRESS

Checks

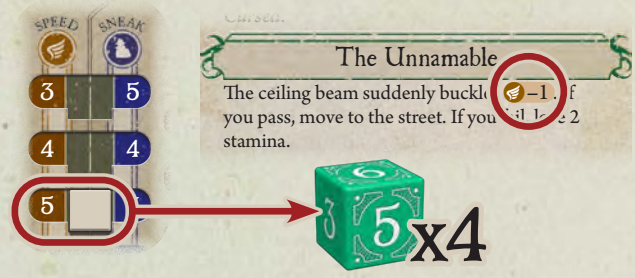
Many effects require the investigators to make checks. A check is a method of determining success or failure, and is based on an attribute of the investigator making the check.

To make a check, an investigator rolls a number of dice equal to the value of the attribute being checked.



An investigator has 5 lore and they are instructed to make a lore check, so they roll 5 dice.

Many checks have positive or negative modifiers. A modifier indicates how many dice to add or subtract to the check.



An investigator has 5 speed and they are instructed to make a speed –1 check, so they roll 4 dice.

If an investigator would roll 0 dice on a check, after applying modifiers, dice are not rolled and the check is an automatic failure.

Unless stated otherwise, when making a check, each die result of 5 or 6 is considered a success. For most checks, if an investigator rolls at least one success, they pass the check. If an investigator does not roll any successes on a check, they fail the check. The effect that instructs an investigator to make the check will also tell them what to do when they pass or fail.

Investigators can also spend clues to roll additional dice on checks. See "Clues" on page 25.

Difficult Checks

Some checks require more than 1 success. If a check requires more than 1 success, the number of successes required is indicated in a green diamond following the check.

Difficult Check

Advanced Checks

There are five types of advanced checks:

- Evasion checks ()
- Combat checks ()
- Horror checks ()
- Spell checks ()
- Gate checks ()

Each of these checks is derived from an attribute and counts as a check of that attribute's type, but can also be modified by effects that support that advanced check specifically. Standard attribute checks, however, do not gain bonuses from effects that grant bonuses to advanced checks.

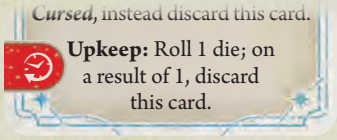
Each advanced check has a special effect and will be covered in a later section.

The Tommy Gun, for example, provides a fight () bonus usable only during a combat check, which is an advanced fight () check. This bonus is not applied during a standard fight () check.

WORK IN PROGRESS

Die Rolls

Sometimes, an investigator may be instructed to roll or more dice to resolve a game effect. These die rolls are not checks and do not receive bonues from effects that only affect checks. Results of 5 or 6 when rolling dice are successes, if applicable. Otherwise, the game will instruct you how to interpret the die roll and resolve its outcome.



Die Roll

Ready and Exhausted

Cards in an investigators play area can be **READY** (faceup) or **EXHAUSTED** (facedown). All cards enter play ready, however, using their effects may exhaust them. When an effect intructs an investigator to exhaust a card, they turn it facedown; it cannot be used again until it is readied, which typically happens during the upkeep phase.

Ready

Exhausted

Discarding, Searching, and Shuffling

When a card is discarded, it is placed on the bottom of its corresponding deck; if not playing with any expansions, when a location card is discarded, its corresponding deck is also shuffled. When a token is discarded, it is returned to its corresponding supply and, if applicable, that supply is randomized.

When an effect instructs an investigator to search a deck, the deck is always shuffled afterward.

Gaining Cards

When an investigator is instructed to gain a specific card by name (for example, "Search the common item deck for ***Whiskey*** and gain it.") they search the indicated deck for that item, add it to their play area, then shuffle the deck. If the specified card does not belong to a randomized deck (for example, a ***Retainer*** or ***Bank Loan***), the deck does not need to be shuffled after the card is gained. If a specified card is not available, it is not gained, and no replacement is drawn in its place.

When an investigator is instructed to gain a card from a specific deck, but name of the card is not specified (for example, "Gain 1 common item"), the investigator draws the top card of the indicated deck and gains it. Since the deck was not searched, it is not shuffled afterward.

Loss Vs Cost

During the game, investigators will be instructed to suffer losses and pay costs. Although the end result is similar, the underlying mechanics are different. A loss can often be reduced by cards, investigator abilities, or other game effects. A cost is paid voluntarily, and its amount cannot be reduced or mitigated unless specified.

Return to The Box

When a game component is returned to the box, it cannot be used for the remainder of the game, unless specified.

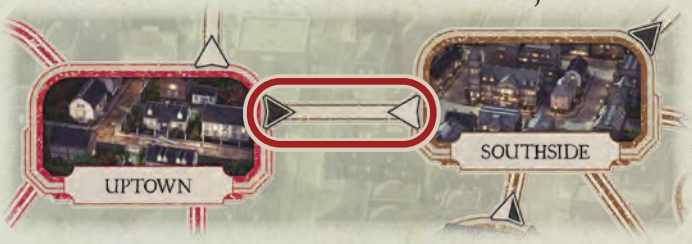
Counters

Counters are tokens used to track game effects. They are taken from the supply when placed and returned to the supply when discarded. Counters are most commonly placed on cards. Some cards instruct investigators to add counters to them, while others enter play with counters already on them. The specific rules governing counters are explained on each component that uses them.

Counter Token

Adjacency

Two spaces are adjacent when they are connected by a solid white or colored line. Two investigators and/or monsters are adjacent when they are in adjacent spaces. Two neighborhoods are adjacent when a space in one neighborhood is adjacent to a space in the other neighborhood. Spaces connected by means other than solid white or colored lines are not adjacent.



THE GAME ROUND

Arkham Horror is played over a series of game rounds. During each round, investigators will resolve four phases:

1. **Upkeep:** Investigators perform game maintenance steps such as readying exhausted cards and focusing their attributes.
2. **Movement:** Investigators move around the board, fight monsters, and trade items with one another.
3. **Encounter:** Investigators resolve encounters, use location abilities, and close or seal gates.
4. **Mythos:** A Mythos card is drawn. Gates and monsters can spawn, clues can be placed on the board, and environments or rumors can come into play.

Each phase is covered in detail in the following sections.

Phase I: Upkeep

During the upkeep phase, investigators perform the following steps in order.

1. Pass Lead Investigator

The investigator that has the lead investigator token passes the token to the investigator on their left. That investigator is now the lead investigator. This step is not resolved during the game's first upkeep phase.

2. Ready Exhausted Cards

Investigators ready each of their exhausted cards. "**Upkeep:**" effects related to readying exhausted cards are resolved during this step.

3. Gain Focus

Investigators gain focus equal to the focus value on their investigator sheet. Focus is normally spent during step 5 to focus an investigator's attributes, but occasionally it can also be spent to resolve various upkeep effects. Unspent focus does not carry over to the next game round.

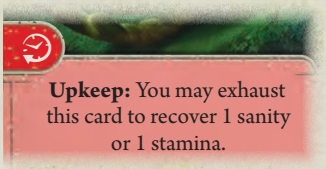
4. Resolve Upkeep Effects

Upkeep Symbol

Some components have upkeep effects. These components are indicated by a red upkeep symbol, and each has the word "**Upkeep:**" follow by an effect. Some upkeep effects have additional timing or conditional restrictions, which are indicated by the effect itself. Each upkeep effect is resolved only once per upkeep phase, unless otherwise indicated. Upkeep effects can be found both on components in an investigator's play area **and** on those in the general play area. They are resolved in the following order:

4a. Investigator Upkeep

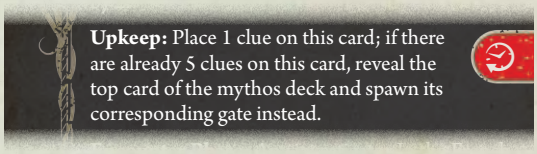
Each investigator resolves the upkeep effects of cards in their play area.



Investigator Upkeep Effect on a Unique Card

4b. Game Upkeep

The lead investigator resolves upkeep effects on general components, such as Mythos cards, in an order of their choosing.



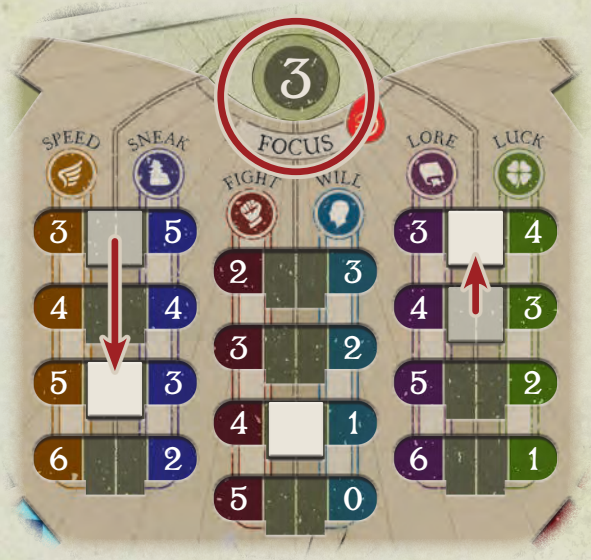
Game Upkeep Effect on a Mythos Card

WORK IN PROGRESS

5. Focus Attributes

Each investigator can spend focus to adjust their attributes. For each point of focus an investigator spends, they may focus a pair of attributes by moving an attribute cube one notch up or down in its column. This will cause one attribute to increase, and its opposing attribute to decrease.

By focusing attributes, investigators can improve an attribute they plan to use during the upcoming phases, giving them a higher chance of success on checks that use that attribute. Investigators can spend their focus however they wish. They may focus multiple attributes once or they may focus the same attribute multiple times, in any combination, so long as the total number of notches moved does not exceed their focus. Investigators who do not wish to focus their attributes are not required to spend all (or any) of their focus.



The investigator spends all of their focus to focus their left and right attribute cubes, with the aim of improving their speed ( ) and their luck ( ), sacrificing equal amounts of sneak ( ) and lore ( ).

WORK IN PROGRESS

Phase II: Movement

During the movement phase, investigators move around the game board in turn order. An investigator's movement is determined by what kind of space they are in.

If an investigator begins their movement in a **CITY SPACE**, they resolve **CITY SPACE MOVEMENT**. If they begin their turn in an **OTHER WORLD SPACE**, they resolve **OTHER WORLD MOVEMENT**. If they begin their turn *delayed* or *lost in time and space*, they resolve those effects instead (see page 17).

City Spaces

The city of Arkham consists of nine neighborhoods, each comprising 2-3 locations that share a border color connected to a street space. Locations and street spaces are both types of city spaces, and make up the majority of the spaces on the game board. Investigators will often spend most of their time in these spaces.

Street Spaces

Street spaces are labeled with the name of the neighborhood, have no corresponding encounters, and are often teeming with monsters. Investigators who end their movement in the streets often leave themselves vulnerable to attack by flying monsters from the ***Sky*** (see page 22).

Street Space

Stable Locations

Stable locations represent various businesses and municipal locales within Arkham. They have encounters, often have location abilities, and their encounters are generally—but not always—safer. Additionally, gates do not open at stable locations.

Stable Location

Unstable Locations

Unstable locations look similar to stable locations, but are marked with a red diamond beneath their art. Unstable locations have clues placed on them during setup that investigators can later pick up. Clues often spawn at unstable locations. Unstable locations have dangerous encounters that often offer rarer rewards than those of stable locations. Additionally, gates can open at unstable locations.

Unstable Location

Location Rewards

Each location has two reward icons on it. Black reward icons indicate a reward that is guaranteed by resolving its location ability. White reward icons indicate a reward often available from encounters at that location.

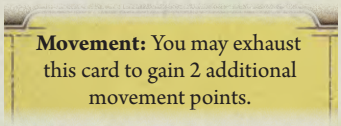
WORK IN PROGRESS

City Space Movement

At the start of an investigator's movement, if they are in a city space, they gain a number of **MOVEMENT POINTS** equal to their speed. Investigators can spend those movement points to move along the solid lines that connect city spaces, with each point spent allowing the investigator to move a distance of 1 space. While spending movement points to move between spaces makes up the core of city space movement, investigators can also use movement effects, evade and encounter monsters, and pick up clues.

Movement Effects

Some items and other components can only be used during the movement phase. These components are indicated by the word "**Movement:**" followed by an effect. Effects that modify an investigator's movement points must be resolved when an investigator gains their movement points. Other "**Movement:**" effects, including those that spend movement points, can be resolved at any time during an investigator's turn during the movement phase before their movement ends.



MOVEMENT EFFECT

Evading Monsters

When an investgator tries to move out of a space that contains one or more monsters, they must make an **EVASION CHECK** against each monster in that space, in an order of their choice.

An investigator that has a sneak (👣) of 6 rolls 3 dice on an evasion check against a monster that has an awareness of -3.

An evasion check is an advanced sneak (👣)check, modified by the awareness value on the front of the monster token.

If an investigator passes an evasion check against each monster in the space they are attempting to leave, they can continue spending movement points to move.

If an investigator fails an evasion check against a monster, they do **not** move out of its space, they lose all of their remaining movement points, and their movement ends. Then, the monster attacks; the investigator loses stamina equal to the **COMBAT DAMAGE** (🩸) on the back of the monster token, and the investigator is **ENGAGED** with that monster.

Ending Movement

When an investigator has no further movement points or "**Movement:**"effects to resolve, if a game effect instructs an investigator to end their movement, or if they are engaged by a monster, their movement ends. When an investigator's movement ends, they lose any remaining movement points and cannot resolve any further "**Movement:**" effects.

When an investigator's movement ends, they must engage or evade (see "Evading Monsters" above) each monster in their space, one at a time in an order of their choice, that they did not already evade or engage during their movement.

Clues

When an investigator ends their movement in a space that contains 1 or more clues, they may gain any number of those those clues. Clues can be used by investigators to seal gates and to roll more dice during checks (see "Clues" on page 25).

CLUE TOKEN

Open Gates

When an investigator ends their movement in a space that contains an open gate, after they have defeated or evaded each monster in that space, they move to the first space of the other world that matches that gate.

WORK IN PROGRESS

Other World Spaces

Other Worlds are depicted alongside one edge of the game board. Investigators can access these Other Worlds by moving through corresponding gates that can open inside Arkham.

Each Other World is divided into two spaces—a first space and a second space. When an investigator first enters an Other World, they are placed in its first space. Later, they will move to its second space, and from there, they can return to Arkham.

Each Other World is associated with 2-4 colored icons. Each icon represents a type of encounter that is likely (but not guaranteed) to be had at that Other World. Red encounters commonly threaten an investigator's stamina, whereas yellow encounters are likely to threaten their sanity. Blue encounters regularly put an investigator's possessions at risk, and green encounters offer respite and safety for an investigator passing through the Other World.

Blue Green Yellow Red

Monsters cannot move into or be placed on Other World spaces, and monsters that appear during Other World encounters never persist beyond the encounter itself.

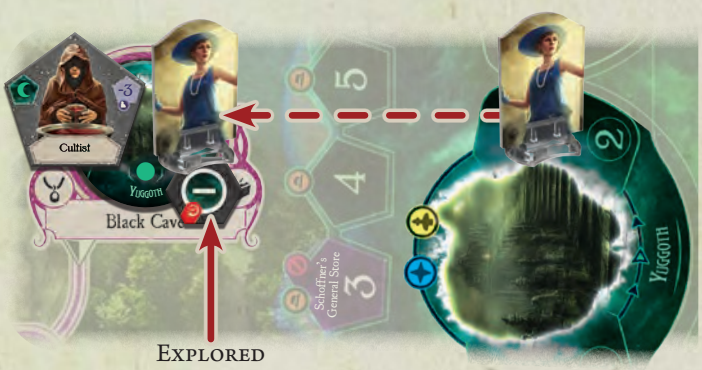
Other World Movement

At the start of an investigators movement, if they are in an Other World space, they do **not** gain movement points, and cannot resolve **"Movement:"** effects that grant or spend movement points. An investigator that starts their movement in the first space of an Other World moves to the second space of the Other World; if they were already in the second space of the Other World, they **RETURN FROM THE OTHER WORLD** instead.

Returning From Other Worlds

When an investigator moves from the second space of an Other World back to Arkham, or when a game effect instructs them to *return from an other world*, they move to any open gate that matches their current Other World and place an **EXPLORED** token beneath their investigator standee with it's **SAFE** side faceup.

When an investigator would *return from the other world*, but there is no open gate that matches their current Other World, they are instead *lost in time and space*; they move to ***Lost in Time and Space*** and are *delayed*.



Explored Token

Explored Token

An investigator that has an explored token beneath their standee is not automatically drawn through the open gate in their space. This allows them to attempt to close the gate during the encounter phase (see "Closing Gates" on page 20).

While the safe side of the explore token is faceup, that investigator is not required to evade or engage monsters in their space unless they choose to. During the next round's upkeep phase, however, the investigator must flip the explored token in their space to its **DANGER** side; that investigator is still is **not** drawn through the gate, but **does** have to evade or engage each monster in their space during the movement phase.

If an investigator on an explored token leaves the space with the gate for any reason, they discard the explored token.

Safe Side Danger Side

WORK IN PROGRESS

Delayed Investigators

Some game effects instruct an investigator to become *delayed*, which hinders their ability to move. When an investigator is *delayed*, they place their investigator standee on its side.

If an investigator is *delayed* at the start their movement, regardless of what type of space they are in, they return their investigator standee to its upright position; they are no longer *delayed*, but their movement ends.

If an investigator stands up from being *delayed* in the Arkham ***Jail Cell***, they also move to the ***Police Station***.

Lost in Time and Space

Some game effects instruct an investigator to become *lost in time and sapce*, which traps them in the space between realities. When an investigator is *lost in time and space*, they move to ***Lost in Time and Space*** and become *delayed*.

If an investigator in ***Lost in Time and Space*** at the start their movement is **not** *delayed*, they move to a city space of their choice, then resolve their movement as normal; investigators in ***Lost in Time and Space*** that **are** *delayed* return their investigator to its upright position and end their movement.

Trading Possessions

If at any point during the movement phase, two ore more investigators are in the same space as one another, they can freely exchange money and cards with the “Item” tag. Cards that do not have the "Item" tag cannot be traded.

✓ Can Be Traded

✗ Cannot Be Traded

Engaging Monsters in Combat

Monsters are an important presence in every game of *Arkham Horror,* and investigators will often have to deal with them—whether because monsters block a street the investigator needs to cross, stand on a gate they need to go through, or simply because they move into an investigator's space.

An investigator becomes engaged with a monster in their space when they fail an evasion check, when instructed a specific game effect, or simply by choosing to engage it. An investigator cannot become engaged with a monster in a different space.

When an investigator becomes engaged with a monster, they flip the monster token to its back side and enter combat. To resolve a combat, perform the following steps in order:

1. Horror Check

First, the investigator attempts to hold on to their sanity by making a **HORROR CHECK** against the monster. A horror check is an advanced will check, modified by the monster's **HORROR RATING**. If the investigator fails, they lose sanity equal to the monster's **HORROR DAMAGE**. Whether they pass or fail, if they are not driven **INSANE** (see "Defeated" on page 23) by losing all of their sanity, they move on to step 2.

Investigators do not make horror checks against monsters that have a dash in place of a horror rating.

The investigator compares their will of 2 to the monster's horror rating of -3. Unfortunately for them, that puts their total number of dice for the check at -1. Since dice can't go negative, that means they roll no dice. They automatically fail the horror check and lose 2 sanity from the monster's horror damage.

2. Fight or Flee

The investigator then chooses whether to fight the monster or flee.

- If the investigator chooses to fight the monster, they make a **COMBAT CHECK** against the monster. A combat check is an advanced fight check, modified by the monster's **COMBAT RATING**.

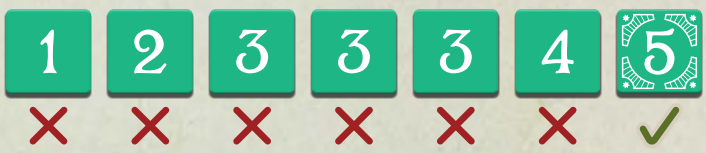
  Additionally, when an investigator makes a combat check, they may choose up to two **HANDS** worth of items (as indicated in the lower-right corner of an item) to use in the combat. Items not occupying a hand do not grant fight bonuses to the investigator, though their other effects can still be used.

  To pass a combat check, an investigator must roll a number of successes equal to or greater than the monster's **TOUGHNESS**. If they pass, combat ends; they defeat the monster and claim its token as a monster trophy.

- If the investigator choose to flee from the monster, they make an **EVASION CHECK**. An evasion check is an advanced sneak check, modified by the awareness value on the front of the monster token. If they pass, the investigator successfully flees and is no longer engaged with that monster.

If the investigator fails to defeat or evade the monster, they move on to step 3

With 4 fight and +3 fight from the .38 Revolver, this investigator's total fight is 7. After the monster's combat rating (+0) is applied, they roll 7 dice. However, they rollonly 1 success—bad luck!



WORK IN PROGRESS

3. Take Damage

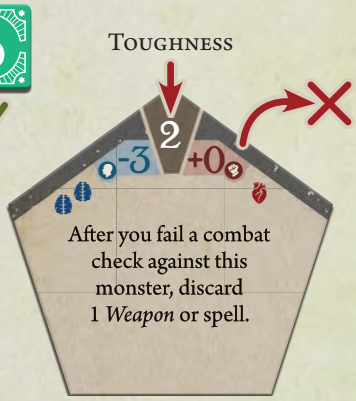
If the investigator fails a combat **or** evasion check against a monster they are engaged with, they lose stamina equal to the monster's **COMBAT DAMAGE** (). If they are not knocked **UNCONSCIOUS** (see "Defeated" on page 23) by losing all of their stamina, they move on to step 4.

Since the monster has a toughness of 2, a single success is not enough to defeat it, and the combat check fails, causing the investigator to lose 1 stamina from combat damage. Worse, the investigator discards their .38 Revolver due to the monsters special ability, which means they only have 4 fight () for the next combat round.

4. Next Combat Round

If the monster was not defeated or evaded, the investigator returns to step 2 and repeats the steps of combat until either the investigator or monster is victorious.

Luckily, even with only 4 dice, the investigator manages to roll 3 succcesses—enough to cover the monster's 2 toughness and 1 extra for good measure! The monster is defeated and the investigator claims it as a trophy.



Phase III: Encounter

During the encounter phase, each investigator resolves an encounter, in turn order. Encounters vary greatly, but often instruct an investigator to make a check, offering rewards for success and penalties for failure. Some encounters offer a choice. If an investigator "may" do something in an encounter, it is optional, and the investigator can choose not to participate.

The type of encounter an investigator resolves is based on their current space:

Streets

An investigator in a street space does not resolve an encounter during the encounter phase unless a specific game effect instructs them to do so.

Locations

An investigator in a location that does not have an open gate draws an location encounter from the deck that matches their current neighborhood. Then, they read and resolve the encounter that corresponds to their location.

Location Ability

Some locations have a **LOCATION ABILITY**, often beginning with the phrase "As an encounter...". An investigator in a location that has a location ability may choose to resolve that location ability instead of drawing an encounter. An investigator cannot, however, forego an encounter in order to use a location ability that they cannot fully resolve.

WORK IN PROGRESS

Closing Gates

An investigator that has an explored token in a location that has an open gate does not resolve a location encounter or location ability. Instead, they make a **GATE CHECK** to attempt to **CLOSE THE GATE**. A gate check is an advanced fight (✊) or lore (💀)check—investigator's choice—adjusted by the **GATE CHECK MODIFIER** on the gate that is to be closed.

Gate Check Modifier

Dimension Symbol

If the investigator passes the check, the gate is closed and the investigator claims it as a trophy. Additionally, each monster on the game board that has the same **DIMENSION SYMBOL** (⬢, ✸, ✚, ♦, ■, ↘, ▲, ☾, ●) as the closed gate is discarded and returned to the monster supply.

Gate Trophy

*After Jenny Barnes closes the gate to **Yuggoth**, the **Mi-Go**, which shares the gate's ● dimension symbol, is discarded. The **Cultist**, however, with its ☾ symbol, is unaffected.*

If the investigator fails the gate check, the gate is not closed. The investigator can attempt another gate check during the next encounter phase, provided that they do not leave the space with the gate, as that would cause the explored token to be dicarded.

Sealing Gates

When an investigator closes a gate, they may optionally choose to **SEAL THE GATE**. To seal a gate, an investigator spends 5 clues to place an **ELDER SIGN TOKEN** in that gate's space. Gates cannot open in a space that contains an elder sign token.

Clue Tokens

Other World

An investigators in an Other World space draws an Other World encounter. Other World encounters are color-coded. If the drawn card does not match any of the colors associated with the investigator's current Other World, they discard that card and draw another one, repeating this process until a matching Other World encounter is drawn.

Then, if their current Other World matches one of the encounter headers on the drawn Other World card, they resolve that encounter. Otherwise, they resolve the encounter under the "Other" header.

Based on its icons, Yuggoth encounters are either blue or yellow. For the Other World encounter shown, since there is no Yuggoth header, the "Other" encounter is resolved.

Returning from Other Worlds

Other World encounters might instruct an investigator to ***return from the other world***, see "Returning from Other Worlds" on page 16.

"A Monster Appears!"

When an encounter informs an investigator that *a monster appears*, they draw a monster from the supply and must either evade or engage it (see "Evading Monsters" and "Engaging Monsters in Combat" on pages 15 and 18). This monster does not count against the monster limit.

If a monster that appears during an encounter is defeated, it is claimed as a trophy as normal. If it is evaded, or if it defeats the investigator, it is discarded; **it does not remain on the board**.

Spawning Gates

When an encounter instructs an investigator to spawn a gate in their space, they follow all of the rules for spawning a gate as detailed in the "Spawn Gate" section on page 21.

WORK IN PROGRESS

Phase IV: Mythos

During the Mythos phase, the lead investigator draws a card from the Mythos deck and resolves its effects in order, top to bottom, left to right.

1. Spawn Gate

If a location is indicated in the upper-left corner of the Mythos card, and there is not already a gate or an elder sign in that space, spawn 1 gate there by following these steps in order:

1. Draw a gate from the top of the gate stack and place it faceup in the indicated space.

2. Discard each clue from that space.
3. Advance doom by 1.

4. Each investigator in the gate's space is drawn through the gate. They move to the first space of the corresponding Other World and are *delayed*.
5. Spawn monsters in the gate's space based on player count (1 monster for 1-4 players, 2 monsters for 5-8 players). If a monster would spawn, but the monster limit has already been reached, that monster is placed in the ***Outskirts*** instead (refer to the corresponding sections on page 28 for a full explanation of the monster limit and the ***Outskirts***).

Monsters Spawned Per Gate

If there is an elder sign token in the indicated location, do not spawn a gate; the seal prevents a gate from spawning.

If there is already an open gate in the indicated location, do not resolve any of the the above steps; instead, resolve a **MONSTER SURGE**.

If the Mythos card does not indicate a location, instead resolve whatever instructions are in its place.

Monster Surge

To resolve a monster surge, draw a number of monsters equal to the number of players or the number of open gates, **whichever is greater**, without looking at them. Place one monster on each space that has an open gate. If any monsters remain to be placed, they are placed one at a time on the open gates, starting with the surging gate and distributing them as evenly as possible among all open gates. If the monster limit is reached, each remaining monster is placed in the ***Outskirts***. (see "Outskirts" on page 28).

2. Place Clues

Place 1 clue in each spaces indicated by clue icons in the upper right of the Mythos card; if the indicated space has a gate in it, do not place that clue.

If a clue is placed in a space with an investigator, that investigator gains the clue; if there are two or more investigators in the space, they choose which investigator gains the clue.

If the Mythos card indicates other tokens in this section—such as activity and closed tokens—place those tokens in the indicated spaces. If an activity token is placed on the board, place a second copy of that activity token on this Mythos card as a reminder.

WORK IN PROGRESS

3. Activate Monsters

Activate each monster that has a dimension symbol (●, ✸, ✚, ♦, ■, ↘, ▲, ☾, ●) that matches an symbol on the Mythos card's monster activation bar, following the activation rules for its monster type.

Monster Types

Each monster type has a unique behavior when activated. A monster's type is indicated by the color and pattern of its border. Monsters that don't move when they activate can still be moved by other game effects.

Black Border—Normal: Normal monsters move 1 space along the indicated movement path.

Yellow Border—Stationary: Stationary monsters have no activation effect.

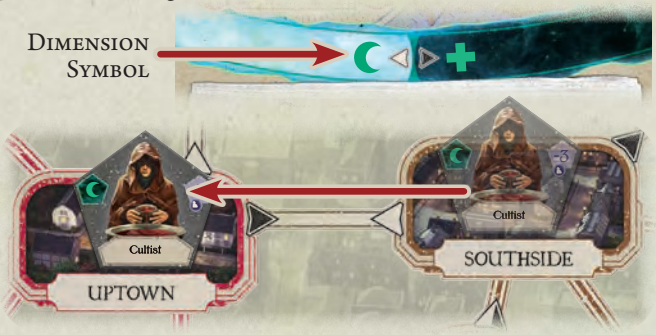
Red Border—Fast: Fast monsters move 2 spaces along the indicated movement path; if they move into a space with an investigator, they stop moving.

Orange Border—Special: Special monsters do not move when they activate. Instead, resolve the activation effects on the back of their monster tokens.

Blue Border—Flying: If a flying monster is in a city space when it activates, it moves to an investigator in an adjacent space; if there are none, it moves to the ***Sky*** instead. If a flying monster is in the ***Sky*** when it activates, it moves to an investigator in any street space; if there are none, it remains in the ***Sky***. When there are multiple investigators that a flying monster could move to, it favors the investigator that has the lowest sneak (👣).

Moving Monsters

When an activated monster moves, it moves is based on which side of the activation bar its symbol appears on. Monsters that have a symbol that matches a symbol on white side of the activation bar move along the white movement paths, following the white arrows. Monsters that have a symbol that matches a symbol on the black side of the activation bar move along the black movement paths, following the black arrows.



*The ☾ symbol on the **Cultist** matches the ☾ symbol on the Mythos card's white activation bar, so it moves along the white movement path, from **Southside** Streets to **Uptown** Streets.*

If a monster is in a space with investigator when it activates, it does not move. If a monster moves into a space with an investigator, there is no immediate effect; that investigator will, however, likely have to evade or engage that monster during the next movement phase.

4. Resolve Mythos Effect

Resolve the main text of the drawn Mythos card. There are three main types of Mythos cards:

Headlines

Headlines have one-time effects. They are resolved and then the card is discarded, unless otherwise indicated.

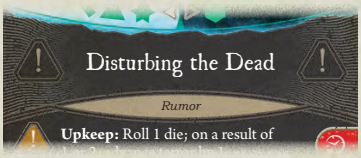
Environments

Environments have persistent effects. After resolving the card, place it near the Mythos deck as a reminder that its effects are active. *Environments* only affect investigators in city spaces.

There can only be one *Environment* in play at a time; if an *Environment* is drawn and there is already one in play, discard the previous one.

Rumors

Rumors have persistent effects. After resolving the card, place it near the Mythos deck as a reminder that its effects are active.



Rumor effects persist until the *Rumor* is passed or failed. Each *Rumor* has its own rules and conditions, as indicated by its text, and often have upkeep effects. Ignoring a *Rumor* will often lead to its failure and spell doom for the investigators—successfully passing them, however, can yield powerful rewards.

There can only be one *Rumor* in play at a time; if a *Rumor* is drawn and there is already one in play, resolve its other instructions normally, but discard it without resolving its Mythos effect.

End of Round

After the Mythos phase is resolved, the round ends, and play moves to the next round, beginning with the upkeep phase.

WORK IN PROGRESS

THE INVESTIGATORS

The investigators are a group of unique characters who have banded together to face the Mythos. Game effects and components that affect the investigators—both bad and good—are explained in detail in the following sections.

Negative Statuses

Unfortunately, many terrible things can befall an investigator as they adventure in Arkham. These awful events are as follows:

Drawn Into The Other World

If at any point outside of the movement phase an investigator suddenly finds themselves in a space that contains a gate, they are *drawn into the other world*; they move to the first space of the Other World that corresponds to the gate and become *delayed*.

Delayed

When an investigator becomes *delayed*, they place their investigator standee on its side. That investigator effectively loses their next movement phase.

If an investigator is *delayed* at the start their movement, regardless of what type of space they are in, they return their investigator standee to its upright position; they are no longer *delayed*, but their movement ends.

Lost in Time and Space

Some game effects instruct an investigator to become *lost in time and sapce*, which traps them in the space between realities. When an investigator is *lost in time and space*, they move to ***Lost in Time and Space*** and become *delayed*.

If an investigator in ***Lost in Time and Space*** at the start their movement is **not** *delayed*, they move to a city space of their choice, then resolve their movement as normal; investigators in ***Lost in Time and Space*** that **are** *delayed* return their investigator to its upright position and end their movement.

Defeated (Insane or Unconscious)

When an investigator's sanity or stamina reach zero, they are driven *insane* or knocked *unconscious*, respectively, and are defeated.

When an investigator is defeated, they perform the following steps:

- They discard half of their clues, rounded down.
- They discard half of their items, rounded down.
- They discard their ***Retainer***, if they have one.

Then, they resolve additional steps based on their current space and whether they are *insane* or *unconscious*.

- If they were driven *insane* in a city space, they recover 1 sanity move to ***Arkham Asylum***; they do not resolve any further encounters during this round.
- If they were knocked *unconscious* in a city space, they recover 1 stamina and move to ***St. Mary's Hospital***; they do not resolve any further encounters during this round.
- If they were defeated in an Other World, they recover 1 sanity if they were driven *insane* or recover 1 stamina if they were knocked *unconscious*. Then, they are *lost in time and space*.

Devoured

When an investigator's sanity and stamina reach zero at the same time, they are *devoured*. Game effects can also cause an investigator to become *devoured*. *Devoured* investigators perform the following steps:

1. They discard all of their cards, money, clues, and any tokens **other than monster and gate trophies**, which they keep for their next investigator.
2. They shuffle their investigator into the unused investigators.
3. If the final battle is not active, they replace their investigator with a new investigator drawn according to the selection rules established during setup. Then, they follow standard setup rules for their new investigator, but do not yet place their standee on the board.
4. At the start of the next upkeep, they place their investigator into play on their starting space, resuming play as normal. If an investigator is *devoured* during the round in which *the Ancient One awakens*, their replacement still enters play at the beginning of the first ready step of the final battle (see page 29).

WORK IN PROGRESS

Arrested

Some effects can cause an investigator to be *arrested*. When an investigator is *arrested*, they perform the following steps:

1. The investigator discards half of their money, rounded down.
2. The investigator moves to the Arkham ***Jail Cell*** and become *delayed*.

Investigators in the ***Jail Cell*** do not resolve encounters during the encounter phase. When an investigator that was *delayed* in the ***Jail Cell*** returns their investigator standee to its upright position, they move to the ***Police Station*** and end their movement; they can have an encounter there during the encounter phase.

Items, Money, and More

As the game progresses, an investigator's play area will be filled with a variety of cards, most of them beneficial, that can help them fight back against the Mythos.

Money

Money can be spent when prompted during encounters, or when resolving location abilities such as those at the ***Curiositie Shoppe*** or ***St. Mary's Hospital,*** to gain a variety of benefits. An investigator can trade money with other investigators in their space during the movement phase.

Money Tokens

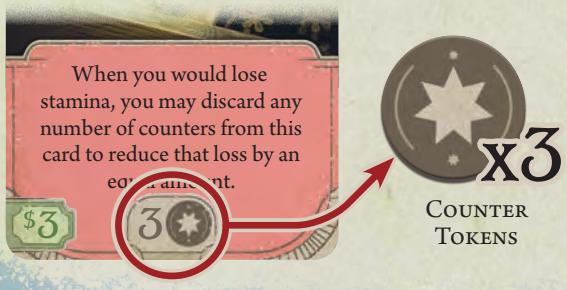
Items

Cards with the item tag provide a myriad of benefits to the investigator who owns them. Common items, unique items, and spells are all types of items. An investigator can trade items with other investigators in their space during the movement phase. Some items have a cost to use, or become exhausted upon use. Exhausted items do not provide any benefits to the investigator that owns them, but are typically readied during the next upkeep phase. Some items have traits, such as *Physical*, or *Tome*. Traits have no inherent effect but are frequently referenced by other game effects.

Items

Counters

Some cards enter play with counters already on them, as indicated by the counters icon and a number. When a card that has a counters icon and a number enters play, place the indicated number of counters on the card. The card's text itself will indicate how the counters are used. When an item with counters no longer has any counters on it, discard it.



Counter Tokens

Concealed Items

An item with the **Concealed** cannot be discarded by a game effect. However, if an investigator is instructed to discard an item in order to resolve a game effect, they can **choose** to discard an item with the Concealed ability.

Additionally, when an investigator discards items as a result of being defeated, they can count a **Concealed** item toward the number of items they must discard; the **Concealed** item, however, is not discarded.

*An investigator has 2 items and is instructed to discard half (1) of them. They choose to "discard" the **Concealed** item and keep the other, allowing them to keep both items.*

Allies

Allies represent unique characters who can join investigators in their battle against the forces of the Mythos. When an ally joins an investigator, they often provide an immediate one-time benefit. While they remain with that investigator, they can also provide lasting effects, such as bonuses to attributes. Allies are not items.

Allies

Skills

Skills represent an investigator's specialized training, expertise, or natural aptitude. When an investigator gains a skill, they gain a permanent passive effect, such as a bonus to an attribute or to a specific type of check. Skills are not items.

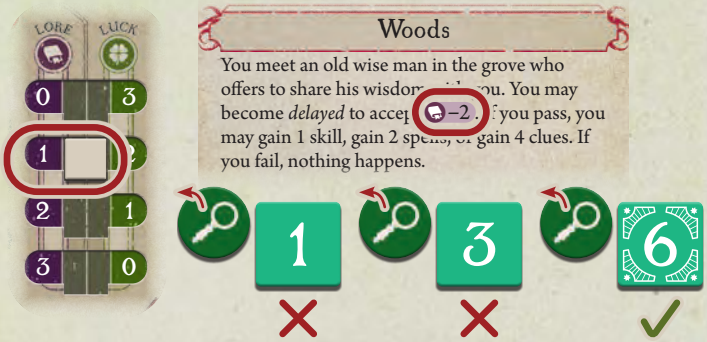
Skills

Clues

Clues are a vital resource available to the investigators. They typically spawn during the Mythos phase and can be picked up when an investigator ends their movement in the clue's space. Game effects—such as spending 5 clues to seal a gate (see "Closing Gates" on page 20)—often require an investigator to spend clues. These effects will instruct the investigators on how the clues are used.

Clue Token

Additionally, after rolling dice during a check, an investigator can spend 1 clue to roll 1 additional die. They can repeat this process until they are satisfied with the results or until they run out of clues. Each spent clue adds 1 die even if the investigator would normally roll 0 dice on a check. Clues cannot be spent to add dice to die rolls that are not checks.



This investigator would normally roll no dice on this check, as their lore ( ) is too low to exceed the check's negative modifier. However, they spend clues, one at a time, in an attempt to pass the check. On the third clue, they succeed!

Special Cards

During the game, investigators might be instructed to gain a special card, such as a ***Retainer***, ***Bank Loan***, ***Silver Twilight Lodge Membership***, ***Blessed***, or ***Cursed***. These cards represent particular circumstances, privileges, or obligations that can alter the way investigators interact with the game. An investigator cannot have more than one copy of each special card. Special cards do not need to be shuffled.

Retainer Special Card

Role Cards

Roles represent special positions an investigator can hold which grant them useful abilities. When an investigator gains a role card, they take also gain all cards associated with that role.

Only one investigator can hold each role at a time. If an investigator is instructed to gain a role already held by another investigator, they do not gain that role or any of its associated cards.

Deputy Role Card

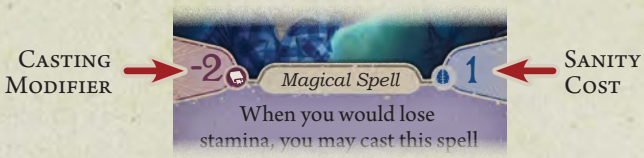
WORK IN PROGRESS

Casting Spells

Spells represent magical knowledge investigators can use to produce a variety of powerful effects. Unlike other items, however, spells must be successfully cast before their effects can be resolved.

Spell Card

To cast a spell, an investigator must first pay its **sanity cost**, indicated on the right-hand side of the spell. If paying this cost does not drive the investigator *insane*, they an then make a **spell check**. A spell check is an advanced lore ( ) check, modified by the spell's **casting modifier**, indicated on the left-hand side of the spell. If they pass, they resolve the spell's effect. Whether the investigator **passes or fails** the spell check, the spell is exhausted, and any hands used to cast the spell during combat remain occupied.



Ritual Spells

Ritual spells are powerful, one-time use magicks. After a **Ritual** spell is successfully cast and its effect is resolved, discard it.

Magical Effects

Some spells instruct investigators to gain a specific magical effect card when the spell is successfully cast.

All copies of each magical effect are identical; they do not need to be shuffled. An investigator cannot have more than one copy of each magical effect.

A magical effect is a representation of a spell's lingering effect that remains active even while the spell is exhausted. Unless otherwise noted, magical effects are discarded at the start of the upkeep phase; they are also discarded if their corresponding spells are discarded, traded away, or otherwise lost for any reason.

Sun's Favor
magical effect card

Hands During Combat

Each item that grants fight ( ) bonuses during combat has a hand icon in its lower-right corner—either a 1-hand icon or a 2-hand icon. When an investigator makes a combat check, they choose up to two total hands worth of items to use during the check. Items that have hand icons which are not being used do not grant fight ( ) bonuses, though other effects on those items can still be used. Items that do not require hands are not restricted; any number can be used.

An investigator has three weapons—one 2-handed weapon and two 1-handed weapons. For any given combat check, they can use either the top weapon or the bottom pair, but not all three.

Investigators can choose different weapons for each combat check, even within the same combat. While most bonuses only affect the combat check being made, some have a longer duration, such as "until the end of this combat". Items with a fixed duration occupy the indicated number of hands across multiple rounds of combat, until either their duration expires or until the investigator chooses to use a different item.

Gate and Monster Trophies

An investigator can spend monster and gate trophies collected during the game to pay for specific effects, such as location abilities. Monster trophies typically have worth assigned to them based off of their toughness values. Unspent trophies are worth points when scoring at the end of the game.

An investigators claims a monster token as a trophy when they **defeat** that monster or when they are instructed to by an effect; they do **not** gain the trophy when a monster is **discarded**.

An investigator claims a gate token as a trophywhen they close a gate, or when they are instructed to by an effect; they do **not** gain the trophy when a gate is **discarded**.

Tokens that have **Endless** are not claimed as trophies.

WORK IN PROGRESS

Each monster in *Arkham Horror* has a monster type that determines what it does when it activates (see "Monster Types" on page 22). In addition, some monsters have one or more monster abilities, which are detailed below.

Ambush
While an investigator is engaged with a monster that has **Ambush**, they cannot flee from it. Combat continues until either the monster or the investigator is defeated.

Endless
When an investigator passes a combat check against a monster that has **Endless**, they do not claim it as a trophy; when it is defeated it is discarded.

Physical and Magical Resistance
When an investigator makes a combat check against a monster that has **Physical** or **Magical Resistance**, the investigator's *Physical* or *Magical* items, respectively, provide only **half** of their normal fight ( ) bonus, rounded up.

Physical and Magical Immunity
When an investigator makes a combat check against a monster that has **Physical** or **Magical Immunity**, the investigator's *Physical* or *Magical* items, respectively, **do not** provide their normal fight ( ) bonus.

Nightmarish X
When an investigator **passes** a horror check against a monster that has **Nightmarish**, they lose X sanity, where X is that monster's **Nightmarish** value.

Overwhelming X
When an investigator **passes** a combat check against a monster that has **Overwhelming**, they lose X stamina, where X is that monster's **Overwhelming** value.

Undead
The **Undead** ability has no inherent mechanical effect, but can be referenced by other game effects.

Mask Monsters
Mask monsters are added to the monster supply **only** when ***Nyarlathotep*** is the Ancient One. They can be identified by the presence of a mask icon on the front of the monster token.

Mask Icon

Empty Monster Supply
If a monster would be drawn, but the monster supply is empty, *the Ancient One awakens.*

WORK IN PROGRESS

THE GAME BOARD

The game board represents the city of Arkham and tracks many key elements and locations. Understanding it is vital to fending off the Mythos.

The Outskirts

There is a maximum number of monsters that can be placed in Arkham at any given time. This is called the **MONSTER LIMIT**, and is equal to the number of investigators plus three. When a monster would be placed on the game board, if the number of monsters across all city spaces and the ***Sky*** is already at the limit, that monster is placed in the ***Outskirts*** instead.

The ***Outskirts*** is not a city space. Monsters do not move to or from the ***Outskirts***. There is also a maxiumum number of monster that can be in the ***Outskirts*** at any given time. This is called the outskirts limit, and is based on the number of investigators, as follows:

Investigators	Limit
1	7
2	6
3	5
4	4
5	3
6	2
7	1
8	0

When a monster would be placed in the ***Outskirts***, if the number of monsters in the ***Outskirts*** is already at the limit, advance **TERROR** by 1 (see "The Terror Track" on page 28). Then, discard that monster and each monster in the ***Outskirts***.

The Sky

Flying monsters can move to and from the ***Sky***. Monsters in the ***Sky*** count against the monster limit. Investigators cannot move to or be placed in the ***Sky*** unless specified. The ***Sky*** is not a city space.

The Terror Track

Terror is the measure of growing panic spreading across Arkham. Monsters overrunning the ***Outskirts*** and many other game effects can cause terror to advance. When that happens, resolve the following steps in order:

1. Move the terror token one space forward along the terror track.
2. Return the top card of the ally deck to the game box; that ally has left town and is no longer available.

When terror advances multiple times at once or directly to a set number, resolve each individual increase separately.

When terror advances to certain thresholds, additional effects are triggered, and certain locations can **CLOSE**:

- When terror reaches 3, close ***Schoffner's General Store.***
- When terror reaches 6, close the ***Curiositie Shoppe.***
- When terror reaches 9, close ***Ye Olde Magick Shoppe.***
- When terror reaches 10, Arkham is overrun. Monsters are no longer placed in the ***Outskirts***; instead, when there are a number of monsters in Arkham equal to twice the monster limit, *the Ancient One awakens.*

When a location is closed, the lead investigator places a closed token on it. Then, each investigator and monster in that space moves to the street. Investigator and monster cannot move to or be placed on a closed location; if an investigator or monster would be placed on a closed location and there is no alternative, place them in its connected street space instead.

If terror would advance and it has already reached 10, advance doom by 1 instead.

*Terror advances to 3, closing **Schoffner's General Store** and returning 1 ally to the box.*

WORK IN PROGRESS

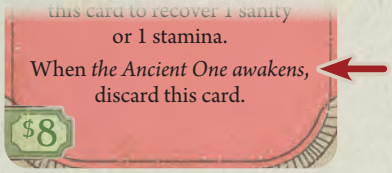
THE FINAL BATTLE

When all else fails and *the Ancient One awakens,* the investigators have one last chance to win: confronting and defeating the Ancient One in a final, desperate battle. The Ancient One can awaken when any of the following occur:

- Doom advances to the final notch of the doom track.
- There are too many open gates, based on player count (see "Open Gates" on page page 7).
- Terror has reached 10 and the number of monsters on the board is twice the monster limit.
- A game effect says that *the Ancient One awakens.*
- A gate or monster would spawn but there are none in their respective supplies.

When *the ancient one awakens*, resolve the following steps:

1. Each investigators in ***Lost in Time and Space*** is *devoured*; they do not take part in the final battle.
2. Discard each *Environment*, *Rumor*, and other persistent Mythos card from play.
3. Discard each ***Retainer*** and ***Bank Loan***.
4. Discard each item that is discarded when *the Ancient One awakens*.



5. Flip the Ancient One sheet and Ancient One dashboard to their final battle sides.

6. Advance doom to the final notch of the doom track, if it was not already.
7. Set the turn tracker and hit tracker cubes to 0 (the leftmost notches). Place the black player count cube on the hit track one slot to the right of the game's player count—the cube is not used in an eight-player game.
8. Resolve the Ancient One's "Start of Battle" ability, if it has one.

Then, the final battle begins.

WORK IN PROGRESS

To defeat the Ancient One, the investigators must retreat doom to 0 before they are all are *devoured*. When the investigators deal a number of hits equal to the number of investigators in the game, including those who have already been *devoured*, retreat doom by 1. Resolve each final battle round as follows, repeating the sequence until either the Ancient One is defeated or all investigators are *devoured*:

1. Ready Step

The lead investigator token passes clockwise. Each investigator readies their exhausted cards, resolve abilities, and focuses attributes as if it were the upkeep phase. Investigators can trade with one another during this step.

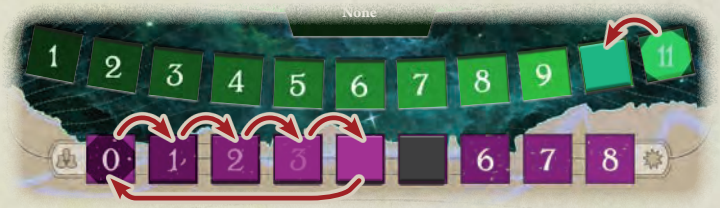
Ancient One Combat Rating

*Sister Mary goes all in. Normally, she would get 4 dice—her base fight ( )of 3, reduced by Silenus's combat rating of –3, increased by +4 from the **Shotgun**—but she is also spending 6 clues.*

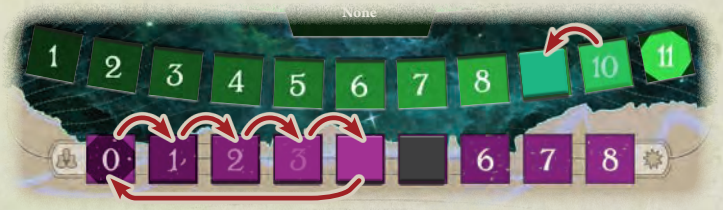
2. The Investigators Attack

In turn order, each investigator makes a combat check against the Ancient One, modified by the Ancient One's **COMBAT RATING**. Each success on a combat check counts as 1 hit against the Ancient One. For each hit, advance the hit track by 1. When the hit track cube reaches the notch that corresponds to the number of investigators, reset the hit track to 0 and retreat doom by 1. Then, continue advancing the hit track for any remaining hits.

*A sizeable hit! Out of her 10 dice, 6 were successes, thanks to being **Blessed**, and 3 of them provided additional hits thanks to the **Shotgun's**, for a total of 9 hits.*



Since she is playing a 4-investigator game, 4 hits are needed to reduce doom by 1. Once the hit track reaches 4 hits, she returns the hit tracker cube to 0 and retreats doom by 1.



She still has 5 hits left from her initial total of 9. Once again, she advaces the track to 4 (the investigator count), returns the hit tracker cube to 0, and retreats doom by 1.

There is still 1 remaining hit. Sister Mary advances the hit tracker to 1, and concludes her attack. The single remaining hit isn't enough to retreat doom, but the hit isn't lost—it remains until it can be used by the next combat check.

WORK IN PROGRESS

3. The Ancient One Attacks

The Ancient One resolves its attack, as described on the Ancinet One's sheet. Then, advance the turn track by 1.

If at any point during the final battle an investigator is defeated, they are *devoured*, and they are not replaced.

If each investigator is devoured, the investigators lose the game. Arkham is lost.

If doom is retreated to 0, the investigators win the game! Arkham is saved, and the Mythos is driven back…for now.

The turn track has advanced twice since the final battle started, and now sits on the 3rd space of the track, indicating it is the third round of the final battle. As such, the modifier for Silenus' attack is –1.

SCORING

If the investigators win the game, the game can be scored. Before scoring, the investigator who has the most unspent gate trophies is awarded the honorary title of ***First Citizen of Arkham***; if there is a tie, the title goes to the investigator who has the most unspent monster trophies.

A game's base score is equal to the Ancient One's highest printed doom value minus the terror value at the end of the game. Then, apply the following modifiers:

- +1 for each unspent gate trophy
- +1 for every 3 unspent monster trophies, as a group
- +1 per surviving investigator
- −1 for each investigator that was replaced
- −1 for each unpaid ***Bank Loan***
- −1 for each ***Elder Sign*** unique item used

WORK IN PROGRESS
